

Seanime Denshi — Quickstart

First-time setup on Windows · mpv playback + ffmpeg/LAN streaming + online streaming (Anikoto) · for v3.8.30 and later

1 Download & install

1. Go to github.com/itsRevela/seanime/releases/latest and download `seanime-denshi-3.8.30_Windows_x64.exe` (the version number may be higher later — always grab the latest).
2. Run it. The installer is unsigned, so Windows SmartScreen will complain: click **More info** → **Run anyway**, then accept the admin (UAC) prompt.
3. Launch **Seanime Denshi**. It starts its own local Seanime server automatically. Sign in with your AniList account when asked, and set your anime **library folder** under **Settings** → **Library** if you want local files/downloads.

Upgrading later: just run the newer installer over the existing install. **Never uninstall first** — uninstalling deletes the app's data. This build intentionally has **no auto-updates**; new versions always come from the same releases page.

2 mpv — full playback functionality

1. Install mpv: open a terminal and run `winget install --id shinchiro.mpv -e --source winget` (no admin needed). If winget ever asks which package, pick **“mpv (shinchiro build)”** — not the Microsoft Store one, and not mpv.net. (Alternatively download a build from mpv.io.)
2. Launch mpv once by itself (run `mpv` in a new terminal, or drop a video onto `mpv.exe`), then close it. This warms up Windows' first-run checks. Tip: `where.exe mpv` prints the installed path — handy for the override field below.
3. In Seanime: **Settings** → **Playback** → under *Video playback*, turn on **“Use local mpv on this device”**.
4. If mpv isn't on your PATH, fill in **“mpv path override”** with the full path to `mpv.exe` (e.g. `C:\Program Files\MPV Player\mpv.exe`). Start with **“Extra mpv args”** empty — a single bad flag there makes mpv exit instantly.

You get: playback in real mpv with episode playlists (`</>` for prev/next), resume-from-last-position, automatic AniList progress sync when you finish an episode, and screenshots saved to `Pictures\seanime`.

Optional — buffering/tuning flags: once everything works, you can put this proven set into **“Extra mpv args”**:

```
--cache=yes --cache-secs=300 --demuxer-readahead-secs=60 --demuxer-max-bytes=2GiB --network-timeout=60
```

It buffers up to 5 minutes / 2 GiB ahead and tolerates slow reads — mainly useful when mpv streams over a network (remote server, slow NAS). On an all-local setup like this one it's optional; add it if you ever see stutter on high-bitrate files. If mpv stops launching after editing this field, clear it first — a typo here is the #1 cause.

3 ffmpeg — transcoding & LAN streaming

Needed for playing in a web browser (direct play/transcoding) and for streaming to other devices on your network.

1. Run `winget install Gyan.FFmpeg` in a regular terminal (installs both `ffmpeg` and `ffprobe`).
2. **Fully quit Denshi and relaunch it** — quit from the tray icon if it minimizes to tray. The server only sees the new PATH after a restart. (Alternative: skip PATH entirely and set **FFmpeg path** / **FFprobe path** explicitly under **Settings** → **Media Streaming**, e.g. `C:\ffmpeg\bin\ffmpeg.exe`.)
3. Tune **Settings** → **Media Streaming**: pick a **Transcode preset**, and enable hardware acceleration if you have an NVIDIA/Intel GPU. CPU works fine to start.

To watch from other devices on your LAN (phone, TV, another PC):

1. Open `%APPDATA%\Seanime\config.toml` (paste that into the Explorer address bar) and under `[server]` set: `host = '0.0.0.0'` and add `password = 'pick-something'` (strongly recommended once it's reachable beyond this PC).
2. Restart Denshi. If Windows Firewall asks, allow access (or add an inbound rule for TCP port **43211**).
3. On the other device, browse to `http://<this-PC's-IP>:43211` and log in with the password.

Note: the server lives inside Denshi — it runs only while the Denshi app is open. Keep Denshi running (tray is fine) while others are streaming.

4 qBittorrent — downloading to your library

Seanime talks to qBittorrent through its **Web UI API**, so it's two steps: turn that on in qBittorrent, then point Seanime at it.

In **qBittorrent** (install from [qbittorrent.org](https://qbtproject.org) if you haven't):

1. **Tools** → **Options** → **Web UI** → check **"Web User Interface (Remote control)"**.
2. Leave the port at **8080** (note it down if you change it — the two sides must match).
3. Either set a username + password, **or** check **"Bypass authentication for clients on localhost"** (simplest, since both apps run on this PC).
4. Click OK and leave qBittorrent running.

In **Seanime** — **Settings** → **Torrents / Torrent Client**:

1. **Default Torrent Client**: qBittorrent. (Leave the torrent search **Default Provider** as it is — AnimeTosho works out of the box.)
2. **Host**: `127.0.0.1` · **Port**: `8080`
3. **Username / Password**: whatever you set in the Web UI — leave both empty if you used the localhost bypass.
4. **Executable**: (optional but recommended) full path to `qbittorrent.exe`, usually `C:\Program Files\qBittorrent\qbittorrent.exe` — lets Seanime auto-launch qBittorrent when it's not running.
5. **Tags / Category**: optional — e.g. category `seanime` to group Seanime's downloads inside qBittorrent.
6. Save. Make sure your **library folder** is set (Settings → Library) — finished downloads land there and get matched into your library automatically.

Test it: open any anime → download an episode via the torrent search. Seanime hands the torrent to qBittorrent, shows progress in its torrent list, and the episode appears in your library when done.

5 Online streaming with Anikoto

1. **Settings** → **Online Streaming** → turn on **Enable** ("Watch anime episodes from online sources").
2. Open the **Extensions** page → **Marketplace** → paste this into the **Marketplace URL** field:
`https://raw.githubusercontent.com/Bas1874/Seanime-Marketplace/refs/heads/main/Marketplace/Main.js`
on
3. Find **"Anikoto"** by **aquaryuo** (id `aq-anikoto` — pick this one if more than one Anikoto is listed) and click **Install**.
4. Open any anime → **Stream online** → choose **Anikoto** as the provider. Episodes play in the built-in player (this is the path that needs ffmpeg-free HLS only — no extra setup).

About dubs: "Switch to dub" depends entirely on the source site. If a dub errors out or plays Japanese audio, the site's dub for that episode is missing or lagging behind — try another provider from the marketplace, or check the Extensions page for provider updates. Not a Seanime problem.

6 If something breaks

Symptom	Fix
---------	-----

SmartScreen blocks the installer	More info → Run anyway (expected — the build is unsigned).
mpv error: "IPC socket..." or "mpv exited (code N)"	Check the mpv path override points at a real <code>mpv.exe</code> (not mpv.net), clear "Extra mpv args", launch mpv once manually, retry.
"ffprobe: executable file not found in %PATH%"	ffmpeg isn't visible to the server — fully quit & relaunch Denshi after installing, or set the explicit FFmpeg/FFprobe paths in Settings → Media Streaming.
Seanime can't connect to qBittorrent	qBittorrent must be running with the Web UI enabled; the port in Seanime must match Tools → Options → Web UI (default 8080). If you set Web UI credentials, mirror them in Seanime.
"Failed to load subtitle track" on online streaming	Fixed in v3.8.30 — make sure you're on 3.8.30 or newer.
An update popup appears	It shouldn't (updates are disabled in this build, v3.8.29+). If you see one on an older version, ignore it — never install updates from inside the app; they would replace this build with the upstream one.
Anything else	Logs: <code>%APPDATA%\seanime-denshi\logs\main.log</code> (app) and <code>%APPDATA%\Seanime\logs\</code> (server). Send the latest one over.
